The SVJour document class users guide supplement for
Mathematische Annalen

29 September 1997

1   Introduction

This document describes the *matann* option for the SVJour LaTeX 2_ε document class. For details on manuscript handling and the review process we refer to the *Instructions for authors* in the printed journal. For style matters please consult previous issues of the journal.

2   Initializing the class

As explained in the main *Users guide* you can begin a document for *Mathematische Annalen* by including

```
\documentclass[matann]{svjour}
```

as the first line in your text. All other options are also described in the main *Users guide*.

3   Extra commands

There is only one additional command:

`\subclass{⟨classification⟩}`

It is needed to specify the *Mathematics Subject Classification*. This command is similar to `\keywords` and should appear as the last command inside the *abstract* environment or – if no abstract is present – as the first command after `\maketitle`.
