One needs the functions from **mathmlPlot** in **examples/**.

1a ⟨* 1a⟩≡

```
inFile <- system.file("data/mathmlQuadratic.xml","XML")
d <- xmlTreeParse(inFile)
plot(1:10, type="n")
text(5,5, mathmlPlot(d))
```

1b ⟨ 1b⟩≡ 1c ▷

$u <- xmlTreeParse(\texttt{"data/mathmlRoot.xml"})text(5, 7, mathmlPlot(u))$

Uses `mathmlPlot`, `text`, and `xmlTreeParse`.

1c ⟨ 1b⟩+≡ ◁ 1b

$u <- xmlTreeParse(\texttt{"data/mathmlSet.xml"})text(5, 9, mathmlPlot(u))$

Uses `mathmlPlot`, `text`, and `xmlTreeParse`.

⟨ 1b⟩
⟨* 1a⟩

`mathmlPlot`: 1b, 1c
`text`: 1b, 1c
`xmlTreeParse`: 1b, 1c
